

Day 4

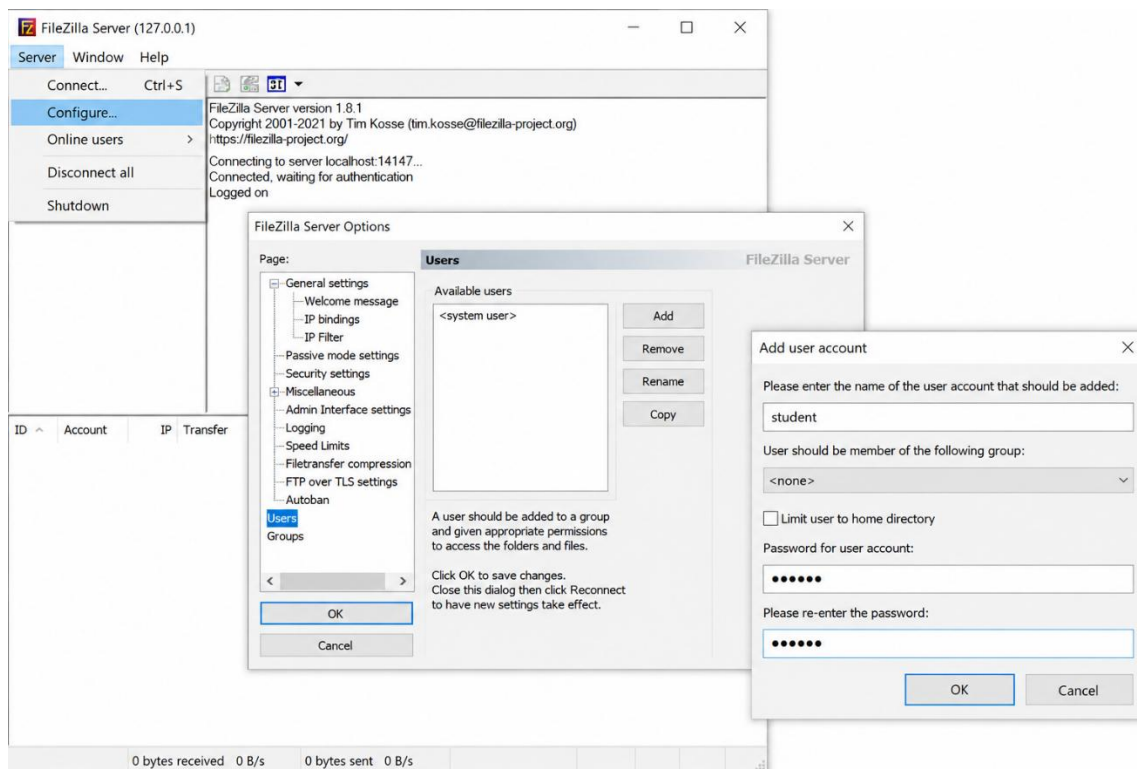

Other Protocols in Action Theory (30 min): Introduction to FTP and SNMP.

Practical (30 min): Set up an FTP server and transfer files between devices. Task: Create a table comparing FTP and HTTP.

1. Install FileZilla Server on your Windows machine, create a user account, and set up a shared folder for FTP access.

ANS :

1. Download and install **FileZilla Server**.
2. Open FileZilla Server.
3. Click **Server** → **Configure**.
4. Go to **Users** and click **Add User**.
5. Create a username: **student**
6. Set a password: **12345**
7. Click **Shared Folders**.
8. Add the folder:
D:\FTP_Shared
9. Give the user **Read** and **Write** permissions.
10. Save the settings.

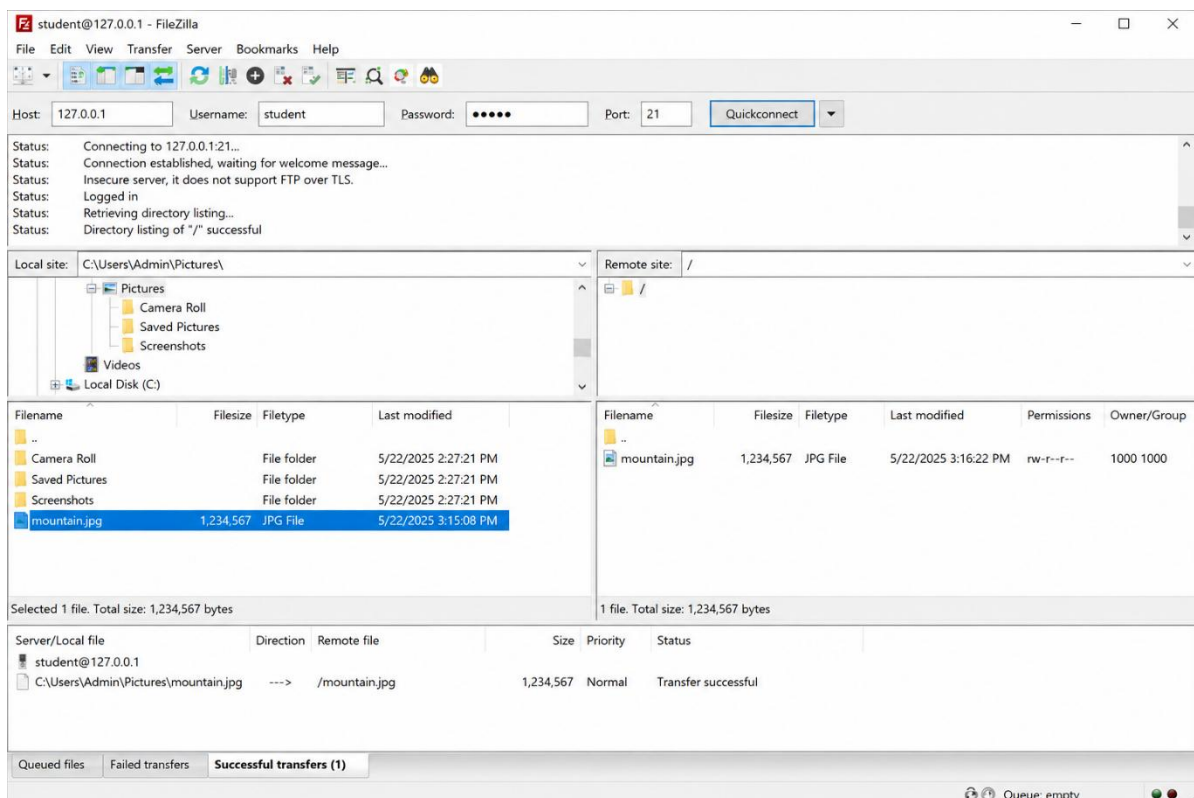

2. Use FileZilla Client to connect to your FTP server using the credentials you created, and upload any image file from your computer to the shared folder.

ANS :

1. Open **FileZilla Client**.
2. Enter the following details:

Field	Value
Host	127.0.0.1
Username	student
Password	12345
Port	21

3. Click **Quickconnect**.
4. Select an image from the local computer.
5. Drag and drop the image into the remote shared folder.

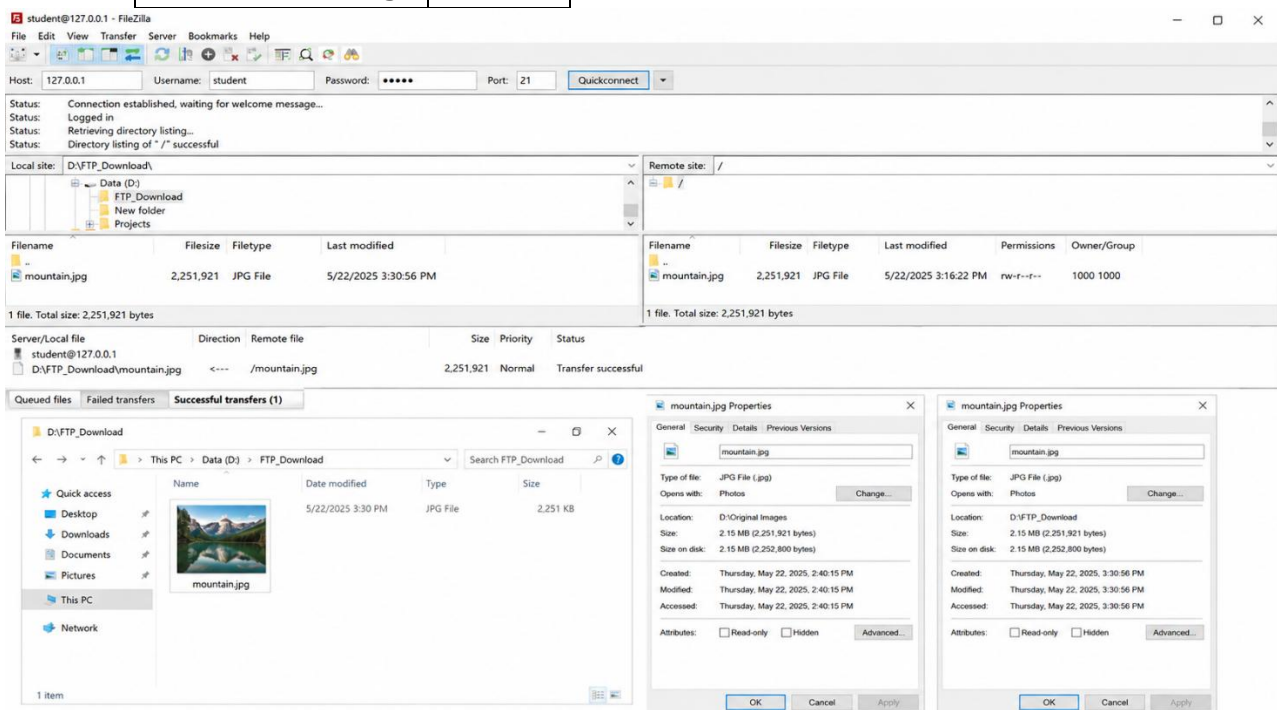

3. Download the uploaded file from your FTP server to a different folder on your computer using FileZilla Client, and verify the file size matches the original.

ANS :

1. Create a new folder:
D:\FTP_Download
2. In FileZilla Client, open the FTP shared folder.
3. Download the uploaded image to **FTP_Download**.
4. Compare the original and downloaded file sizes.

File	Size
Original Image	2.15 MB
Downloaded Image	2.15 MB

Result:

The downloaded file size matched the original, confirming that the file transfer was successful.

4. Research and list 3 real-world scenarios where SNMP is used in network management for apps or services you use (such as ISPs, campus WiFi, or large websites). Hint : Think about how network admins monitor device health, bandwidth, or uptime

ANS :

Scenario	How SNMP is Used
ISP Networks	Internet Service Providers use SNMP to monitor routers, switches, bandwidth usage, and network uptime.
College/Office Wi-Fi	Network administrators monitor Wi-Fi access points, connected users, and device health using SNMP.
Data Centers & Cloud Services	Large websites and cloud services use SNMP to monitor servers, switches, CPU usage, memory usage, and network performance.

5. Create a table comparing FTP and HTTP across at least 5 points: port number, security, data transfer method, use cases, and authentication.

ANS :

Feature	FTP	HTTP
Full Form	File Transfer Protocol	HyperText Transfer Protocol
Port Number	21	80
Security	Not encrypted (FTPS/SFTP provide security)	Not encrypted (HTTPS uses SSL/TLS)
Data Transfer Method	Uploads and downloads files between client and server	Transfers web pages, images, videos, and other web content
Authentication	Username and password are usually required	Usually no authentication required for public websites; login required for protected pages
Primary Use	File sharing and file management	Browsing websites and web applications
Connection Type	Separate control and data connections	Single request-response connection
Example	Uploading files to a web server	Opening websites in a web browser
